IS4990 COMPREHENSIVE GROUP PROJECT · PROJECT PROPOSAL

SWOT Tank Water Tracker for Sri Lanka

An AI system that estimates how much water each tank holds, using free satellite data

Group 6 · JARVIS

Supervisors: Dr. Upeksha Ganegoda (IT) · Prof. (Mrs) Thanuja Sandanayake (IDS)

October 2026

Tanks around Mahakanadarawa, Sentinel-2, 28 Feb 2026. Contains modified Copernicus Sentinel data 2026.

We can see the tanks, but not the water in them

~23,000

small tanks of 80 ha or less in Sri Lanka, the base of dry-zone farming

National Tanks Survey, in Lopane et al., 2025

118

reservoirs publish daily water levels; village tanks publish none

Irrigation Department, Reservoir Status, 25 Oct 2026

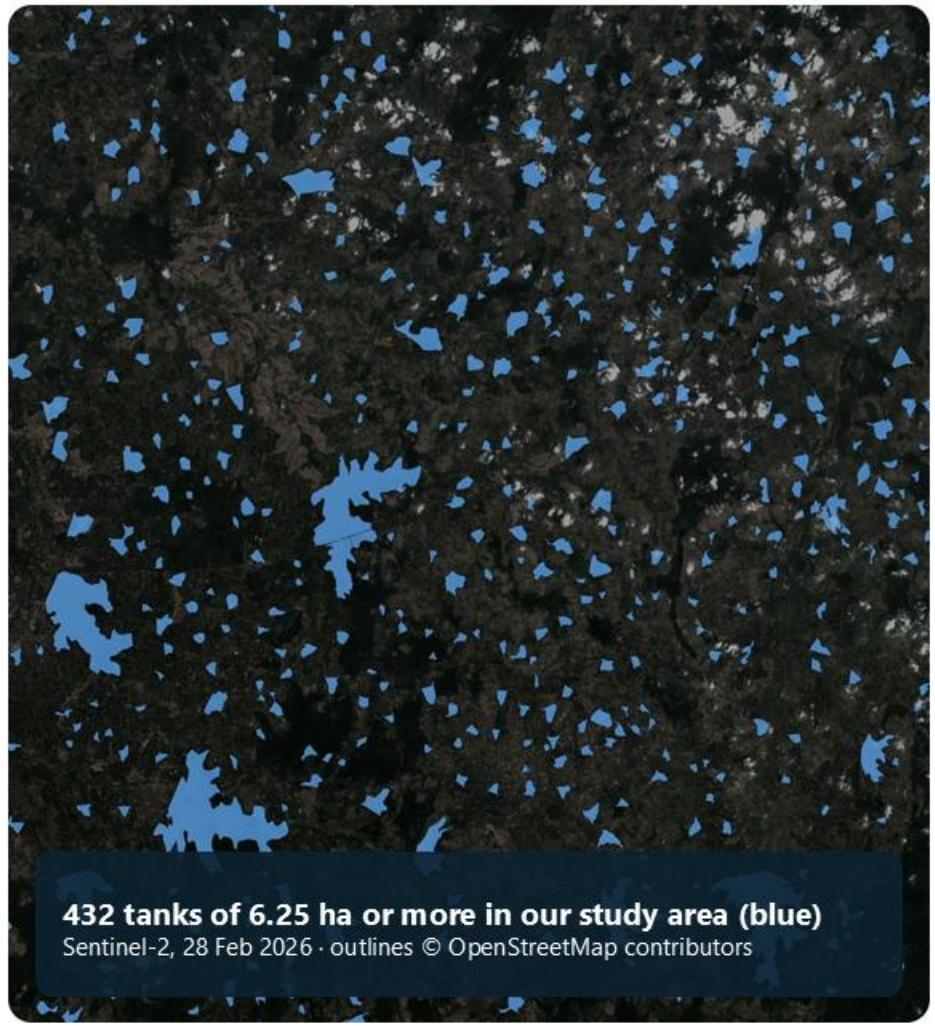

10,650

water bodies mapped from satellites, but by area only, with no volume

IFAD, 2026

A shallow tank and a deep tank of the same size hold very different amounts of water.

Cyclone Ditwah, Nov 2025: 1,160 small tanks damaged (Department of Agrarian Development)

432 tanks of 6.25 ha or more in our study area (blue)
Sentinel-2, 28 Feb 2026 · outlines © OpenStreetMap contributors

SWOT gives the height. We turn it into water

What SWOT gives

- The water height of each lake, about twice every 21 days
- Only for lakes in its prior lake list
- Mostly "suspect" readings on small village tanks
- No volume, and nothing between passes

What our project adds

- Water area from Sentinel-1 and Sentinel-2 by AI, even under cloud and water plants
- A height–area–volume curve for every tank
- Storage in m^3 and % full, every 5–12 days
- Accuracy checked against Irrigation Department gauges
- A dashboard for irrigation officers and farmers

SWOT is the ruler. We turn its readings into water in the tank.

SWOT: a satellite that measures water height

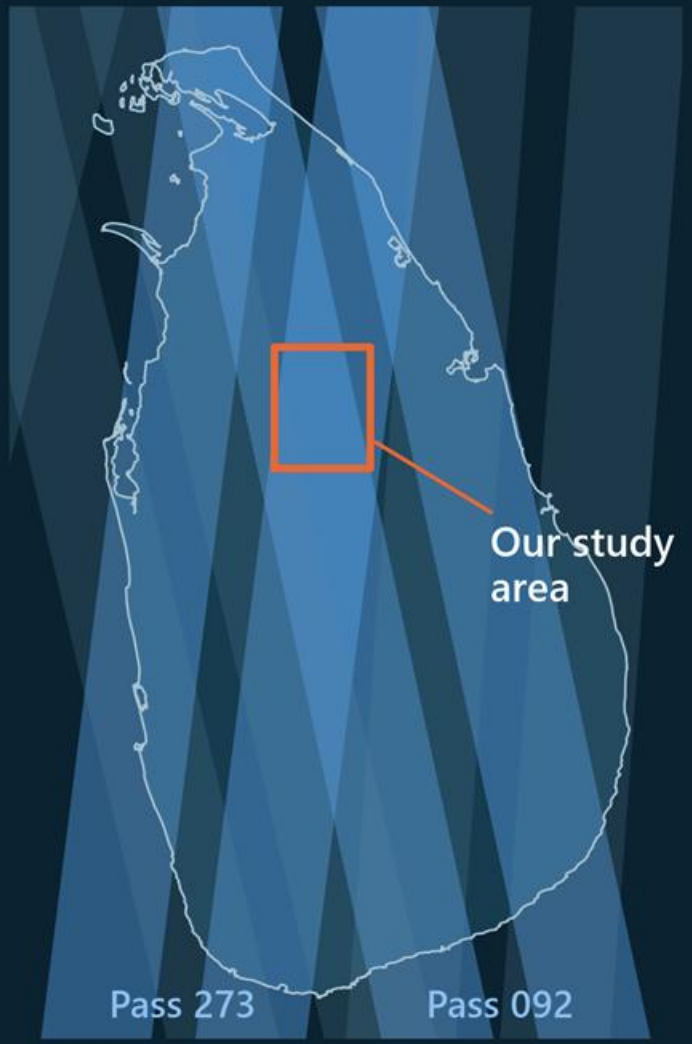

Illustration: NASA/JPL-Caltech

Dec 2022
launched by NASA and CNES (France)

120 km
wide strip measured on each pass

21 days
until the same pass comes back

2 passes
see our tanks: 273 and 092

What SWOT sees: one pass, every lake at once

198

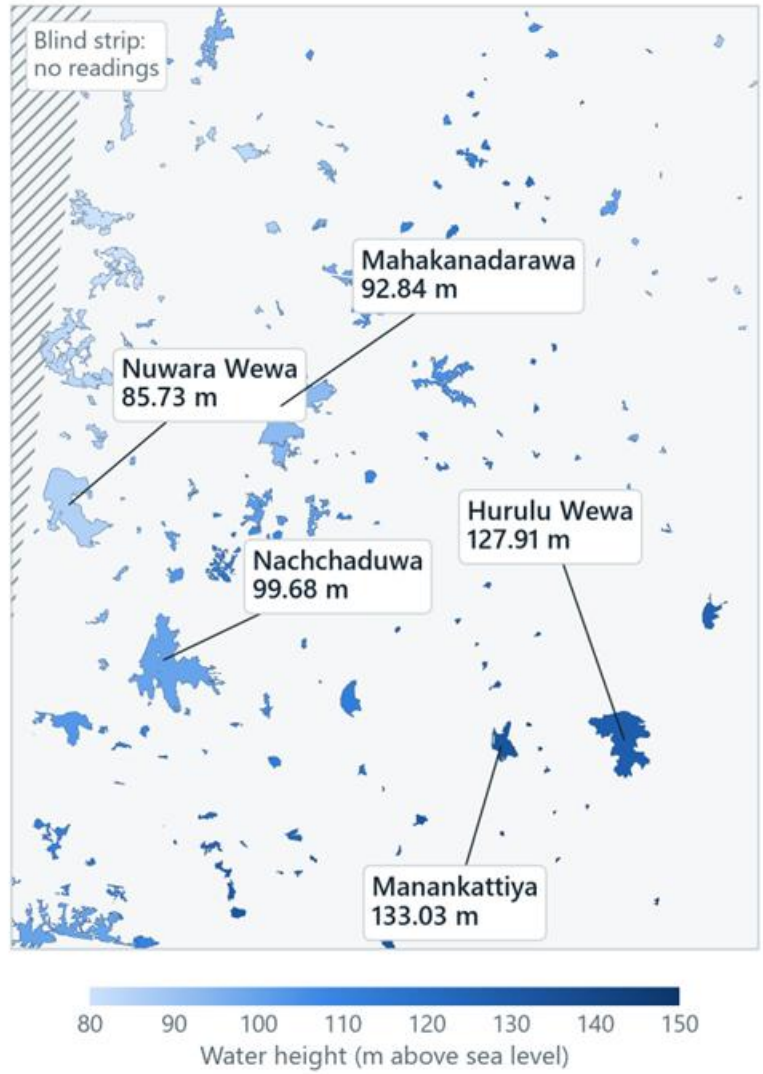

lakes measured in a single pass

SWOT pass 273 on 11 Oct 2026, in our 44 × 55 km study area

Each colour is the water height SWOT measured, in metres above sea level.

All 5 of our reservoirs were measured on this pass, for example Hurulu Wewa at 127.91 m.

SWOT cannot measure the strip right under itself, shown hatched on the map.

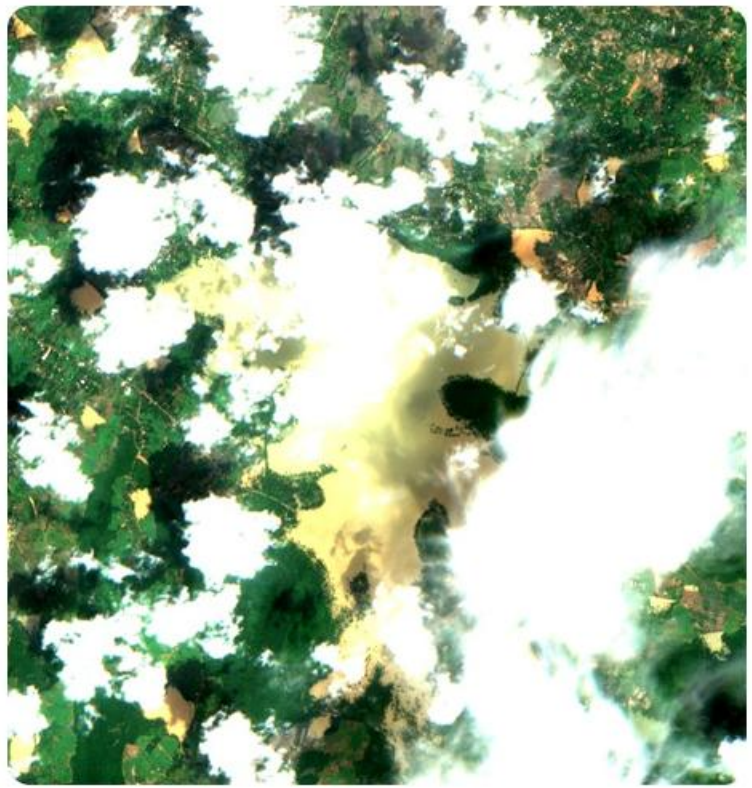

Data: NASA/JPL and CNES, SWOT Lake Single-Pass product, version D, from NASA PO.DAAC.

Clouds hide the tanks. Radar sees through them

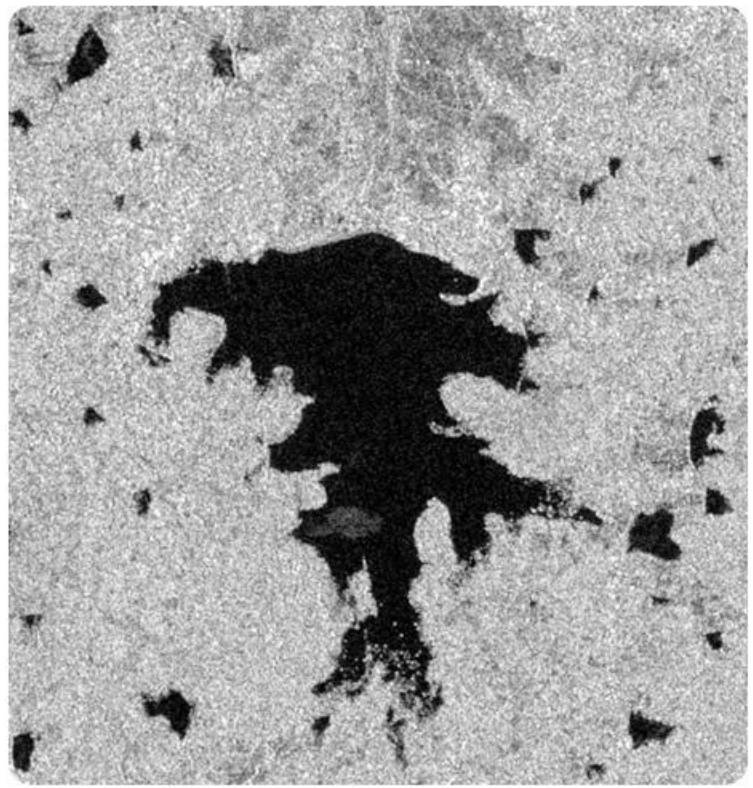

Sentinel-2, clear day

Hurulu Wewa, 28 Feb 2026 · optical, 10 m

Sentinel-2, monsoon cloud

Hurulu Wewa, 30 Nov 2025 · the tank is hidden

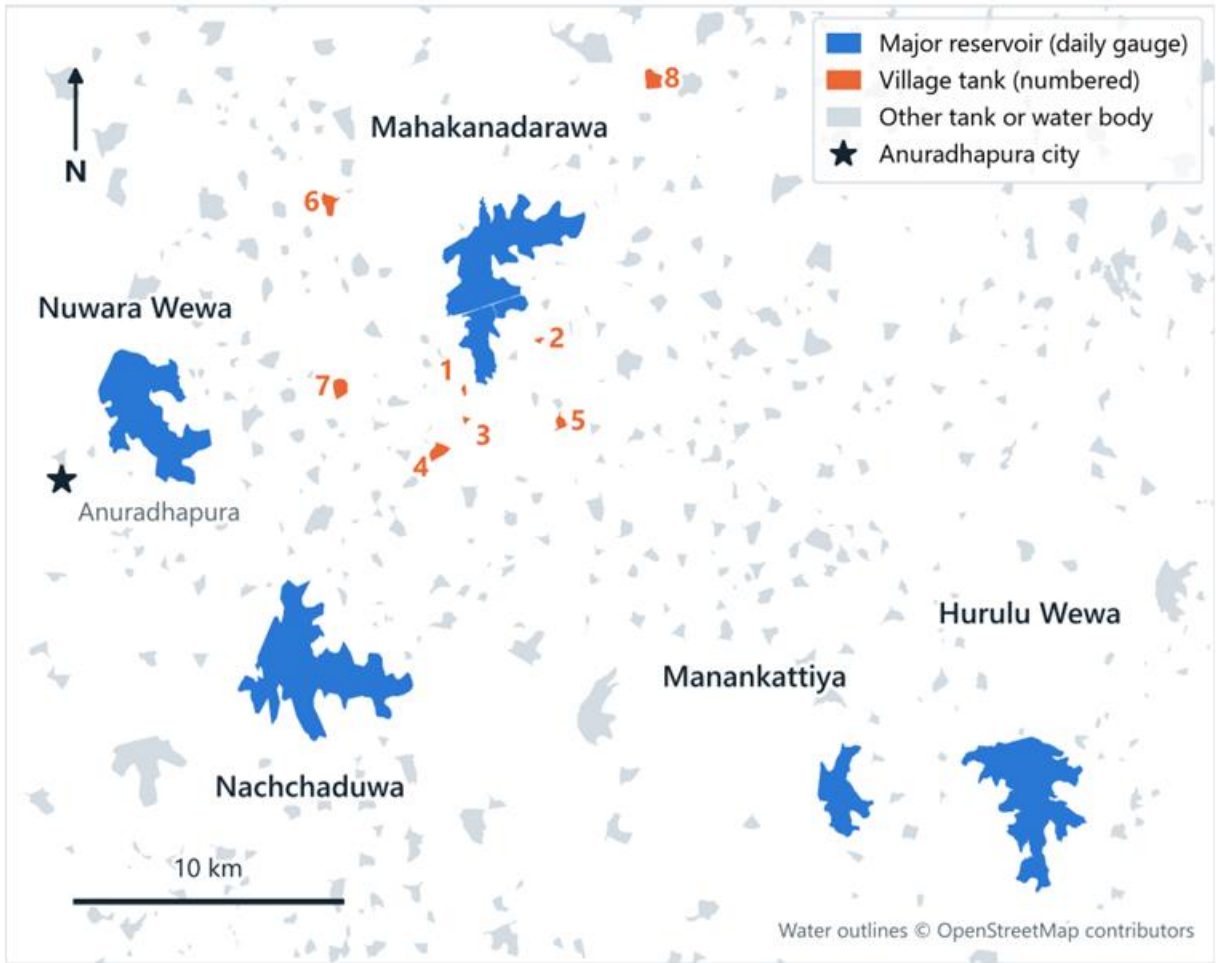

Sentinel-1 radar

Hurulu Wewa, 2 Dec 2025 · water shows dark

Only 17–22% of Sentinel-2 dates were clear over our test tanks, so radar is a core input.

Contains modified Copernicus Sentinel data 2025–2026.

Study area: 5 reservoirs and 8 village tanks

5 major reservoirs

Hurulu Wewa, Mahakanadarawa, Manankattiya, Nachchaduwa and Nuwara Wewa, all with daily gauge readings

8 village tanks

0.4–5 km from Mahakanadarawa: 2 open water, 3 mixed and 3 mostly covered by water plants

Seen by SWOT passes 273 and 092

All 13 tanks, about twice every 21 days, with 47–90 usable readings each since July 2023

Why here

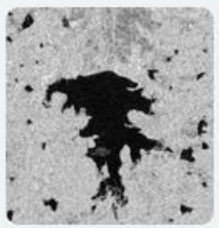

Dry-zone tank cascades (ellanga), flat land, and official gauges to check against

How it works

Sentinel-1 and Sentinel-2

Radar and optical images, every 5–12 days

AI water map

Open water, water under plants, and land

SWOT water heights

From NASA's Hydrocron service since July 2023, with poor readings removed

Height–area–volume curve

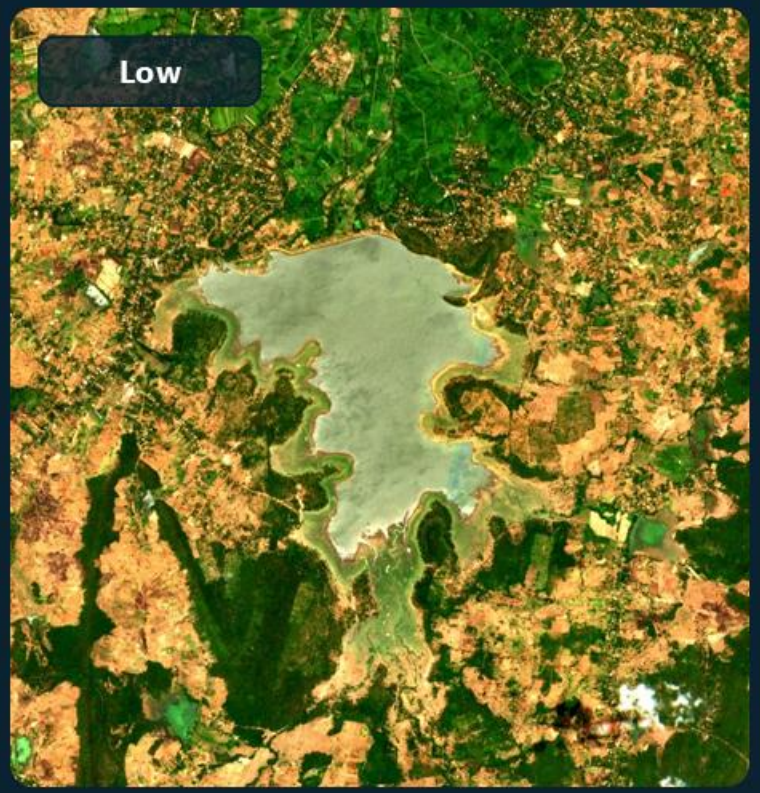

One per tank: each SWOT height paired with the AI water area of the same day

Storage every 5–12 days

Each new water map becomes a volume, shown on a dashboard

Checked against Irrigation Department gauges and official storage figures

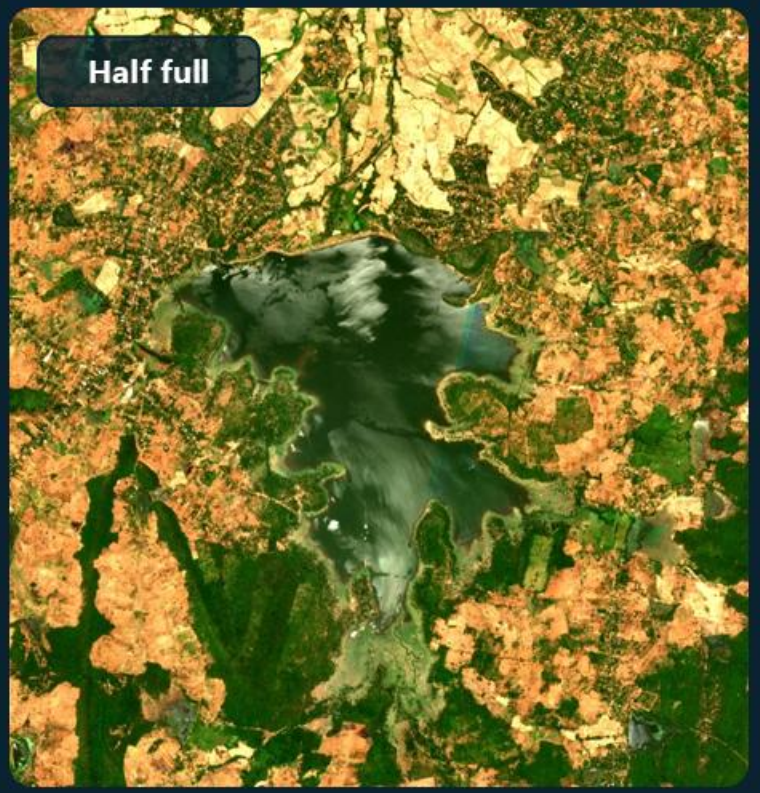

Our method in three pictures: Hurulu Wewa

127.59 m SWOT height

6.1 km² of water

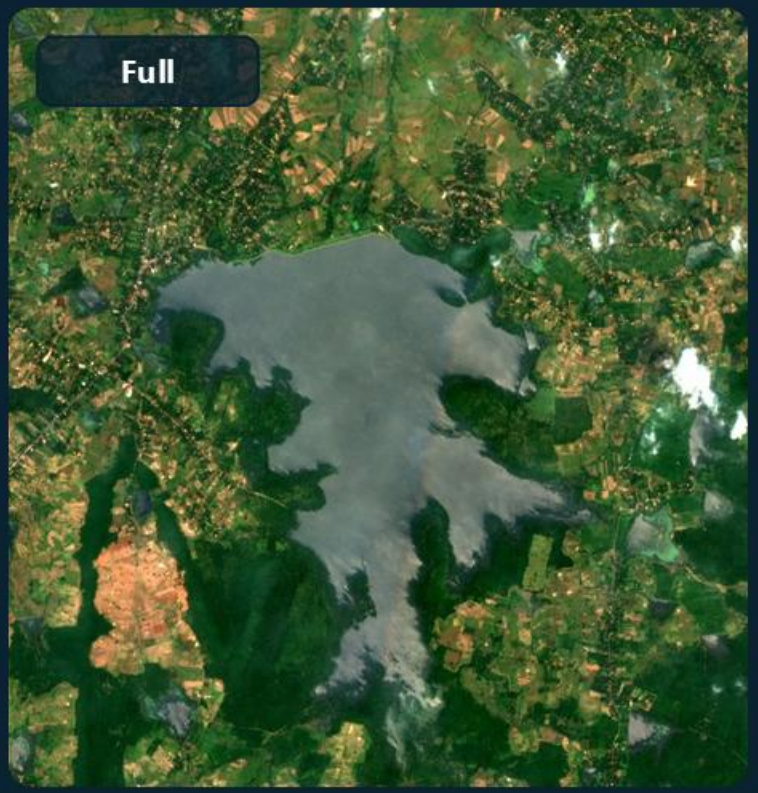

Sentinel-2 29 Jul 2023 · SWOT 30 Jul 2023

129.50 m SWOT height

8.3 km² of water

Sentinel-2 and SWOT, 30 Jul 2025

132.35 m SWOT height

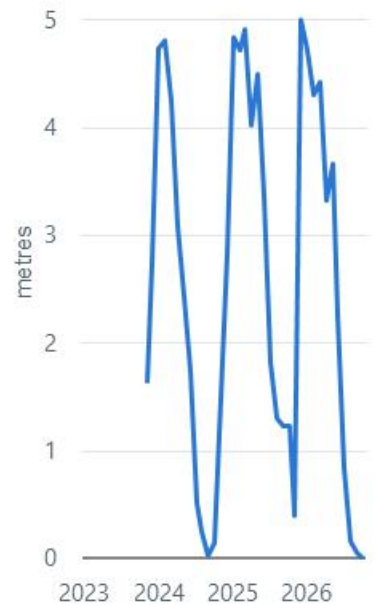

10.8 km² of water

Sentinel-2 28 Feb 2026 · SWOT 10 Mar 2026

Three years of SWOT water levels

Monthly average of best-quality readings, in metres above each reservoir's lowest month.
The sharp rise at the end of 2025 is Cyclone Ditwah.

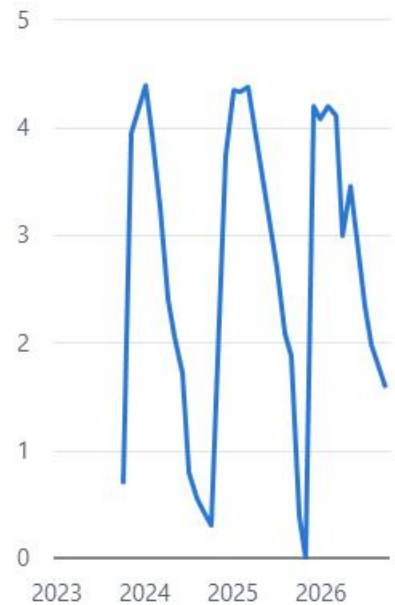

Hurulu Wewa

71 best-quality readings

rose and fell up to 5.0 m

Mahakanadarawa

63 best-quality readings

rose and fell up to 4.4 m

Manankattiya

57 best-quality readings

rose and fell up to 3.7 m

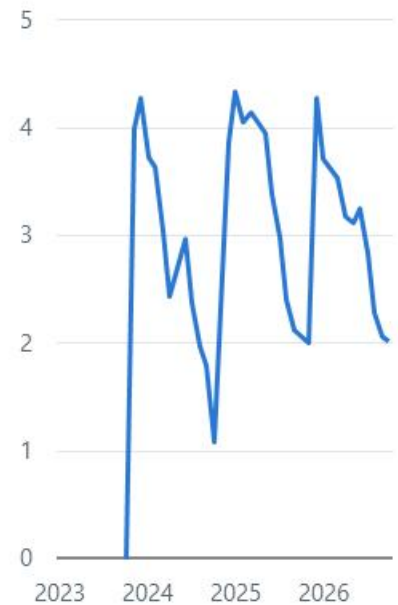

Nachchaduwa

55 best-quality readings

rose and fell up to 3.0 m

Nuwara Wewa

53 best-quality readings

rose and fell up to 4.3 m

Source: NASA PO.DAAC Hydrocron, SWOT lake product version D, July 2023 to October 2026. Gaps are months without a best-quality reading.

We tested the data before proposing

Five quick checks in October 2026, using the real SWOT, Sentinel-2 and gauge data.

1 · LAKE IDS

86%

of Irrigation Department tanks in our area have a SWOT lake ID (43 of 50); 58% of all mapped tanks

RISK

2 · HEIGHTS

26,641

SWOT readings on 400 lakes since July 2023; village tanks get mostly "suspect" readings

RISK

3 · GAUGE CHECK

~1 m

difference between SWOT and gauges on 4 reservoirs, with readings 13 to 20 days apart

OK

4 · WATER AREA

17–22%

of Sentinel-2 dates clear; water plants hide the water in 3 village tanks

RISK

5 · TRAINING DATA

2

labelled water datasets ready to use: Sen1Floods11 and S1S2-Water

PASS

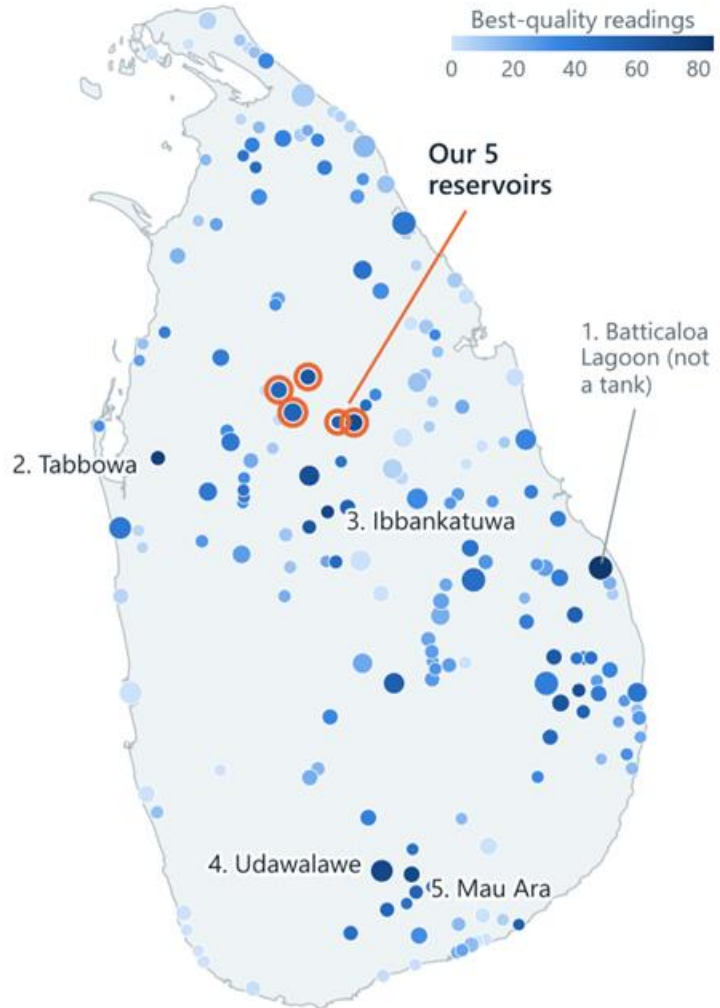

Verdict: GO, with changes. Sentinel-1 radar and a water-plant class became core parts of the plan, and RQ2 now tests SWOT's "suspect" readings.

Why these tanks? We checked all of Sri Lanka

6th of 187

Hurulu Wewa's rank among Sri Lanka's big lakes (1 km^2 or more), by best-quality SWOT readings

- All 5 of ours are in the island's top 22, and they are the top 5 in our study area
- The island's top tanks are spread from Puttalam to Hambantota, far from our village tanks
- Ours sit next to the 8 village tanks and share the same 2 SWOT passes
- All 5 have daily Irrigation Department gauges; 2 of the island's top 5 tanks do not

Best quality: quality flag 0, crossover flag 0–1, dark water 10% or less (Köhn and Nielsen, 2026).

Research questions

1. How accurately can deep learning map tank water from Sentinel-1 and Sentinel-2, even under cloud or water plants?

   Measured by IoU and F1 against hand-labelled water masks

2. How accurate is SWOT on reservoirs and on small village tanks, and can its "suspect" readings be trusted?

   Measured by error in cm against gauge readings

3. Does AI water area plus SWOT height give storage close to official and measured values?

   Measured by error as a % of capacity

4. Can storage be forecast 2–4 weeks ahead from recent storage and rainfall?

   Stretch goal, compared with a "no change" forecast

What we will deliver, and when

- A labelled dataset of Sri Lankan tank water masks
- An AI water map that works under cloud and water plants
- Height–area–volume curves for all 13 tanks
- Storage every 5–12 days, shown on a dashboard
- A research paper, for example for UoM's ICITR conference

Nov 2026
Proposal, ethics and data requests

15 Dec 2026
Study area confirmed after the cascade and name checks

Dec 2026 – Apr 2027
Labelled data, gauge readings, AI water model and SWOT curves

Mar – May 2027
Storage estimates, validation and dashboard

30 Jun 2027
Thesis, paper and final submission

Thank you

Questions and feedback are welcome.
